

Course Unit: 15709 – General Microbiology

Year 1 Semester 2 ISCED Code: 511 ECTS: 5,0

Type of Course Unit: Compulsory **Delivery Mode:** Face-to-face **Language of Instruction:** Portuguese

COURSE COORDINATOR: António Manuel Gouveia carloto

HOURS OF WORK

TOTAL HOURS	Contact Hours								Hours in autonomous work
	Theory	Theory and practice	Practical and laboratory work	Field work	Seminar	Internship	Tutorial guidance	Other	
125	30		30						65

Prerequisites (if applicable): Not applicable

LEARNING OUTCOMES (knowledge, skills and competence)

Acquisition of basic knowledge about the morphology, physiology, metabolism, growth and control of microorganisms and microbial ecology.

Differentiation and characterization of different microbial groups.

Importance of beneficial and harmful microorganisms in nature.

Work rules in Microbiology Laboratory. Preparation of the material and the culture media. Laboratory techniques of observation, isolation, identification and study of microorganisms.

CONTENTS

1. Evolution of Microbiology.
2. Microbial taxonomy.
3. Reproduction and growth of microorganisms.
4. Prokaryotic microorganisms: Bacteria.
5. Eukaryotic microorganisms: fungi, algae and protozoa.
6. Virus.
7. Microbial metabolism for energy producer: fermentation, respiration and photosynthesis.
8. Microbial Genetics.
9. Environmental Microbiology.
10. Introduction to laboratory work in microbiology.
11. Material used in the microbiology laboratory: preparation and handling; sterilization methods.
12. Culture media.
13. Microscopy. Microscopic examination: examination fresh and stained preparations.
14. Technique of observation, inoculation, isolation and quantification of microorganisms.

DEMONSTRATION OF THE CONTENTS COHERENCE WITH THE COURSE UNIT'S LEARNING OUTCOMES

This course aims to prepare students with the knowledge and skills necessary for understanding the role of microorganisms. To this purpose the topics include a description of the various groups of microorganisms in terms of their morphological, biochemical and cultural characteristics. Examples are given of the action of microorganisms, either beneficial or harmful roles. This course has a strong laboratory component that is intended for students to become able to work in a microbiology laboratory, including general tasks such as preparation and sterilization of equipment and media, working in aseptic conditions, recognition of different types of microorganisms, techniques for the isolation and identification of microorganisms and quantifying total microorganisms in single samples.

TEACHING METHODOLOGIES

The lectures will be predominantly expository with audiovisual media. The practical classes take place in the Microbiology Laboratory with the support of a Laboratory Guide. All techniques are preceded by a previous demonstration.

DEMONSTRATION OF THE COHERENCE BETWEEN THE TEACHING METHODOLOGIES AND THE LEARNING OUTCOMES

In the theoretical component, although classes are predominantly expository, it is intended that students engage in an active way. Whenever possible it resorts to practical examples and applied to the course creating discussion groups. The classes are taught in a Microbiology laboratory so that students can train and acquire the specific techniques of microbiology. Students should read the protocol previously to practical classes and at the beginning of the lesson there will be a demonstration of the techniques and wherever possible the students work individually. The topics covered in the lectures are concerned with the issues developed in practical classes

EVALUATION METHODS

It is required to attend 75% of the practical classes. The final score is the result of the arithmetic average of two components: practical and theoretical notes. The practice note is calculated by averaging two practice tests and theoretical note is the final exam grade.
